

Kidney Stones Symptoms

This article has been read our visitors and greatly appreciated. Hopefully you will enjoy it likewise.

Initially, a person who is suffering from kidney stones will not experience any serious symptoms of the disease. Kidney stone symptoms get serious as time passes and can turn disastrous if ignored for a longest duration. These stones are hard multitude of substances, which may include the foreign substances, as well as those from the body itself as dead tissues.

Until the size of these stones is small, they do not create any problems. However, if they grow in size and start block the passageway of the substances through the kidneys. Consequently kidney stones give rise to some problems, which may be either simple or they can be very severe too.

However, in the initial stages the kidney stones do not show any symptoms. On the other hand, the symptoms may be very modest or only one of them may occur. If just one of the kidney stones symptoms appears, the people do not take it too seriously. Some other reasons are accounted for it. However, when some of the other symptoms too, start appearance then the people get mindful of that something is wrong with them.

Due to the happening of the kidney stones, the patients feel pain in the abdomen. This is the most common kidney stones symptom. Generally, this pain begins from a mild one and it goes on increasing as the stone may grow in size.

The second symptom that the patient of kidney stone faces is the pain during urination or the menstruation. This happens if the stone blocks the flow of the urine from the kidney to the urinary tract. This hurting can be very serious depending on the blockage that the stone proves to be for the urine. Similar thing happens during the menstruation. If it becomes very painful then there is a need of medication.

In addition to the hurting during the urination, other problems with the urine also occur. One of them is the gain in the frequency of the urine and in addition to that, it becomes difficult to hold the urine. Most of the times, this occurs along with the hurting during the urination. Because of this, the problems of the patients increase.

Some people also experience coming out of blood with the urine. This happens due to the injury that the stone may cause to the nearby tissues. Sometimes due to the same reasons, some other secretions are also observed in the urine. This changes the color of the urine. Therefore, the change in the color of the urine is also a kidney stones symptom.

In addition to the problems with the urination, the other parts in the pelvic region i.e. the genital parts also experience pain.

The kidney stone also causes infections and inflammations in the surrounding region and thence these may lead to the other problems too. In such cases, the patient feels dull and unenergetic. He may develop nausea. This sickness and vomiting without any, other reason is also a symptom of the kidney stones.

In addition to this, they patients sometimes experience fever and chills. During this fever the hurting in the bones and other parts of the body also occur. The bones of the back and abdominal parts are affected. Especially the back hurting is a severe happening during the kidney stones. This hurt may be modest in the beginning but in most of the cases, it becomes very high in the later stages.
